Site Audit: Issues

atmabalatravels.netlify.app

Generated on October 23, 2026

• The website audit for atmabalatravels.netlify.app on October 23, 2026, shows that the website is generally in good health, with only two critical issues and five minor warnings identified.

• The first critical issue is one broken webpage that cannot be loaded or accessed, which prevents both visitors and search engines from viewing the content.

• The second critical issue is a security setup error where the website's safety certificate does not match its web address, which can cause web browsers to block visitors with a safety warning.

• One webpage is missing its main headline, which makes it more difficult for search engines and visitors to understand the main topic of the page.

• One webpage has too much hidden website code compared to actual readable text, which can slow down the website and make it harder for search engines to scan.

• One webpage has a very low word count with fewer than 200 words, which search engines may view as not having enough helpful information for visitors.

• The website is missing a technical security setting that helps it load securely, which might cause access issues for visitors who are using older web browsers.

• The website has unoptimized background code files containing unnecessary spaces, which makes the files larger and can slow down page loading speeds.

• This report provides a snapshot of current activity. Deeper trend analysis will become more reliable with a longer data history.

Errors

Errors

Project name: atmabalatravels.netlify.app

Errors	Amount
1 page returned a 4XX status code **About this issue:** A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: - DDoS protection system - Overloaded or misconfigured server **How to fix:** If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: - Contact your web hosting support team - Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt	1 0

Errors	Amount
1 issue with incorrect certificate name **About this issue:** If the domain or subdomain name to which your SSL certificate is registered doesn't match the name displayed in the address bar, web browsers will block users from visiting your website by showing them a name mismatch error, and this will in turn negatively affect your organic search traffic. **How to fix:** Contact your website administrator and ask them to install the correct certificate. Since subdomains also require their own certificates, you can use a wildcard or multi-domain SSL certificate that allows you to secure multiple subdomains.	1 0
0 pages returned 5XX status code	0 0
0 pages don't have title tags	0 0
0 issues with duplicate title tags	0 0
0 pages have duplicate content issues	0 0
0 internal links are broken	0 0
0 pages couldn't be crawled	0 0
0 pages couldn't be crawled (DNS resolution issues)	0 0
0 pages couldn't be crawled (incorrect URL formats)	0 0
0 internal images are broken	0 0
0 pages have duplicate meta descriptions	0 0
Invalid robots.txt format	0 0
0 sitemap.xml files have format errors	0 0
0 incorrect pages found in sitemap.xml	0 0

Errors	Amount
0 pages have a WWW resolve issue	0 0
Viewport not configured	0 0
0 pages have too large HTML size	0 0

0 issues with hreflang values	0 0
0 hreflang conflicts within page source code	0 0
0 issues with incorrect hreflang links	0 0
0 non-secure pages	0 0
0 issues with expiring or expired certificate	0 0
0 issues with old security protocol	0 0

Warnings

Warnings

Project name: atmabalatravels.netlify.app

Warnings	Amount
1 page doesn't have an h1 heading **About this issue:** While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly. **How to fix:** Provide a concise, relevant h1 heading for each of your page.	1 0
1 page has low text-HTML ratio **About this issue:** Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster. **How to fix:** Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.	1 0
1 page has a low word count **About this issue:** This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts. For more information, please view this video **How to fix:** Improve your on-page content and be sure to include more than 200 meaningful words.	1 0

Warnings	Amount
1 subdomain doesn't support SNI **About this issue:** One of the common issues you may face when using HTTPS is when your web server doesn't support Server Name Indication (SNI). Using SNI allows you to support multiple servers and host multiple certificates at the same IP address, which may improve security and trust. **How to fix:** Make sure that you web server supports SNI. Keep in mind that SNI is not supported by some older browsers, which is why you need to ensure that your audience uses browsers supporting SNI.	1 0
1 issue with unminified JavaScript and CSS files **About this issue:** Minification is the process of removing unnecessary lines, white space and comments from the source code. Minifying JavaScript and CSS files makes their size smaller, thereby decreasing your page load time, providing a better user experience and improving your search engine rankings. For more information, please see this Google article. **How to fix:** Minify your JavaScript and CSS files. If your webpage uses CSS and JS files that are hosted on an external site, contact the website owner and ask them to minify their files. If this issue doesn't affect your page load time, simply ignore it.	1 0
0 external links are broken	0 0
0 external images are broken	0 0
0 links on HTTPS pages lead to HTTP page	0 0
0 pages don't have enough text within the title tags	0 0
0 pages have too much text within the title tags	0 0
0 pages have duplicate H1 and title tags	0 0
0 pages don't have meta descriptions	0 0
0 pages have too many on-page links	0 0

Warnings	Amount
0 URLs with a temporary redirect	0 0
0 images don't have alt attributes	0 0
0 pages have too many parameters in their URLs	0 0
0 pages have no hreflang and lang attributes	0 0
0 pages don't have character encoding declared	0 0
0 pages don't have doctype declared	0 0
0 pages have incompatible plugin content	0 0
